

Calculated Variables in the 2015

Behavioral Risk Factor Surveillance System

Data File

(Version #4 - Revised: May 27, 2016)

INTRODUCTION:

This document provides information on calculated variables for the 2015 Behavioral Risk Factor Surveillance System survey. These variables are calculated from responses to questions in the survey. There are three types of calculated variables:

1. Variables used to stratify and weight the data (not included in this document).
2. Intermediate variables, which are derived from a question response and are used to calculate some other variable or risk factor. Example: WTKG2 is derived from the WEIGHT2 variable in the survey. WTKG2 is then used to calculate the body mass index variable (_BMI4). Most—but not all—of the intermediate variables end with an underscore such as FTJUDAY_.
3. Variables used to categorize or classify respondents. Most of these begin with an underscore such as _BMI4. Exceptions are: _DENSTR2, _GEOSTR, and _STATE, which are determined before the interview. Some of the calculated variables group continuous variables—such as weight, age, or body mass index—into categories. Other calculated variables regroup non-continuous variables to simplify analyses. The common focus of these variables is on health behaviors that are associated with a risk of illness or injury.

The tables in this report include a description of what the responses mean and a copy of the code used to calculate these variables in SAS®. The syntax of the code, as given, may or may not work in the particular statistical program that you are using.

_DRNKWEK *Calculated variable for calculated total number of alcoholic beverages consumed per week. _DRNKWEK is derived from DROCDY3_ and AVEDRNK2 by multiplying the total number of drink occasions per day (DROCDY3_) by the average number of drinks per occasion (AVEDRNK2) times seven days.*

|--------------|--|---|
| 0 | Did not drink | Respondents who did not drink in the past month. (DROCDY3_=0) |

per week | Respondents reported number of alcoholic drinks in the past week. (0 < DROCDY3_ < 990) |

_RFDRHV5 *Calculated variable for heavy drinkers (adult men having more than 14 drinks per week and adult women having more than 7 drinks per week). _RFDRHV5 is derived from _DRNKWEK, ALCDAY5, and SEX. This new calculated variable for heavy drinking is replacing the heavy drinking measure used in the past (i.e., _RFDRHV4). This change in the time period used to assess heavy drinking (i.e. from daily average to weekly) have no impact on prevalence estimates for heavy drinking among adults because high average daily alcohol consumption and high weekly alcohol consumption are mathematically equivalent. This change was made to help differentiate heavy drinking, which is based on high average consumption; from moderate drinking, which is based on daily consumption below a specified consumption level (one drink per day for women; 2 drinks per day for men), as defined by the 2015-2020 Dietary Guidelines for Americans, and not based on average consumption.*

1 No Male Respondents who reported having 14 drinks per week or less, or Female Respondents who reported having 7 drinks per day or week. (Sex=1 and _DRNKWEK <= 1400 or Sex=2 and _DRNKWEK <= 700 or ALCDAY5=888)

2 Yes Male Respondents who reported having more than 14 drinks per week, or Female Respondents who reported having more than 7 drinks per week. (Sex=1 and _DRNKWEK > 1400 or Sex=2 and _DRNKWEK > 700)
